

Smart Contract Security Audit Report

The SlowMist Security Team received the Litentry team's application for smart contract security audit of the Litentry token on Jan. 21, 2021. The following are the details and results of this smart contract security audit:

Token name	

LIT

File name and hash(SHA256):

erc20-lit-master.zip:

7ba1e0ae77943df365bb7b35292e8bbe290f8da6460cd430a21b08388cd3708f

The audit items and results:

(Other unknown security vulnerabilities are not included in the audit responsibility scope)

No.	Audit Items	Audit Subclass	Audit Subclass Result
1	Overflow Audit		Passed
2	Race Conditions Audit	_	Passed
	Authority Control Audit	Permission vulnerability audit	Passed
3		Excessive authority audit	Passed
	Safety Design Audit	Zeppelin module safe use	Passed
		Compiler version security	Passed
4		Hard-coded address security	Passed
		Fallback function safe use	Passed
		Show coding security	Passed
		Function return value security	Passed
		Call function security	Passed
5	Denial of Service Audit	<u>-</u>	Passed
6	Gas Optimization Audit		Passed
7	Design Logic Audit		Passed
8	"False top-up" vulnerability Audit	_	Passed
9	Malicious Event Log Audit		Passed

10	Scoping and Declarations Audit		Passed
11	Replay Attack Audit	ECDSA's Signature Replay Audit	Passed
12	Uninitialized Storage Pointers Audit		Passed
13	Arithmetic Accuracy Deviation Audit		Passed

Audit Result: Passed

Audit Number: 0X002101230001

Audit Date: Jan. 23, 2021

Audit Team: SlowMist Security Team

(Statement: SlowMist only issues this report based on the fact that has occurred or existed before the report is issued, and bears the corresponding responsibility in this regard. For the facts occur or exist later after the report, SlowMist cannot judge the security status of its smart contract. SlowMist is not responsible for it. The security audit analysis and other contents of this report are based on the documents and materials provided by the information provider to SlowMist as of the date of this report (referred to as "the provided information"). SlowMist assumes that: there has been no information missing, tampered, deleted, or concealed. If the information provided has been missed, modified, deleted, concealed or reflected and is inconsistent with the actual situation, SlowMist will not bear any responsibility for the resulting loss and adverse effects. SlowMist will not bear any responsibility for the background or other circumstances of the project.)

Summary: This is a token contract that does not contain the tokenVault section. The total amount of tokens in the contract remains unchanged. OpenZeppelin's SafeMath security module is used, which is a recommended approach. The contract does not have the Overflow and the Race Conditions issue.

The source code:

Context.sol

//SlowMist// The contract does not have the Overflow and the Race Conditions issue

pragma solidity ^0.6.0;

* @dev Provides information about the current execution context, including the

* sender of the transaction and its data. While these are generally available

* via msg.sender and msg.data, they should not be accessed in such a direct

* manner, since when dealing with GSN meta-transactions the account sending and

* paying for execution may not be the actual sender (as far as an application

```
* is concerned).

* This contract is only required for intermediate, library-like contracts.

*/

contract Context {

// Empty internal constructor, to prevent people from mistakenly deploying

// an instance of this contract, which should be used via inheritance.

constructor () internal {}

function _msgSender() internal view virtual returns (address payable) {

return msg.sender;
}

function _msgData() internal view virtual returns (bytes memory) {

this; // silence state mutability warning without generating bytecode - see

https://github.com/ethereum/solidity/issues/2691

return msg.data;
}
}
```

Address.sol

//SlowMist// The contract does not have the Overflow and the Race Conditions issue pragma solidity ^0.6.2; /** * @dev Collection of functions related to the address type */ library Address { /** * @dev Returns true it `account' is a contract. * * [IMPORTANT] * ==== * It is unsafe to assume that an address for which this function returns * false is an externally-owned account (EOA) and not a contract. * * Among others, `isContract' will return false for the following * types of addresses: * * - an externally-owned account

```
* - a contract in construction
     * - an address where a contract will be created
        - an address where a contract lived, but was destroyed
     * ____
    function isContract(address account) internal view returns (bool) {
        // According to EIP-1052, 0x0 is the value returned for not-yet created accounts
        // ano 0xc5d2460186f7233c927e7db2dcc703c0e500b653ca82273b7bfad8045d85a470 is returned
        // for accounts without code, i.e. 'keccak256(")'
        bytes32 codehash;
        bytes32 accountHash = 0xc5d2460186f7233c927e7db2dcc703c0e500b653ca82273b7bfad8045d85a470;
        // solhint-disable-next-line no-inline-assembly
        assembly { codehash := extcodehash(account) }
        return (codehash != accountHash && codehash != 0x0);
    }
     * @dev Replacement for Solidity's `transfer`: sends `amount` wer to
     * 'recipient', forwarding all available gas and reverting on errors.
     * https://eips.ethereum.org/EIPS/eip-1884[EIP1884] increases the gas cost
     * of certain opcodes, possibly making contracts go over the 2300 gas limit
     * imposed by `transfer`, making them unable to receive funds via
     * `transfer`. {sendValue} removes this limitation.
     * https://diligence.consensys.net/posts/2019/09/stop-using-soliditys-transfer-now/[Learn more].
     * IMPORTANT: because control is transferred to 'recipient', care must be
     * taken to not create reentrancy vulnerabilities. Consider using
     * {ReentrancyGuard} or the
https://solidity.readthedocs.io/en/v0.5.11/security-considerations.html#use-the-checks-effects-interactions-pattern[checks
-effects-interactions pattern].
    function sendValue(address payable recipient, uint256 amount) internal {

SafeMath.sol

```
//SlowMist// The contract does not have the Overflow and the Race Conditions issue
pragma solidity ^0.6.0;
 * @dev Wrappers over Solidity's arithmetic operations with addea overflow
 * checks.
 * Arithmetic operations in Solidity wrap on overflow. This can easily result
 * in bugs, because programmers usually assume that an overflow raises an
 * error, which is the standard behavior in high level programming languages.
 * 'SafeMath' restores this intuition by reverting the transaction when an
 * operation overflows.
 * Using this library instead of the unchecked operations eliminates an entire
 * class of bugs, so it's recommended to use it always.
//SlowMist// OpenZeppelin's SafeMath security module is used, which is a recommend approach
library SafeMath {
     * @dev Returns the addition of two unsigned integers, reverting on
     * overflow.
     * Counterpart to Solidity's `+` operator.

IERC20.sol

```
//SlowMist// The contract does not have the Overflow and the Race Conditions issue

pragma solidity ^0.6.0;

/**

* @dev Interface of the ERC20 standard as defined in the EIP.

*/

interface IERC20 {

/**
```

```
* @dev Returns the amount of tokens in existence.
function totalSupply() external view returns (uint256);
 * @dev Returns the amount of tokens owned by 'account'.
function balanceOf(address account) external view returns (uint256);
/**
 * @dev Moves 'amount' tokens from the caller's account to 'recipient'.
 * Returns a boolean value indicating whether the operation succeeded.
 * Emits a {Transfer} event.
function transfer(address recipient, uint256 amount) external returns (bool);
 * @dev Returns the remaining number of tokens that 'spender' will be
 * allowed to spend on behalf of 'owner' through {transferFrom}. This is
 * zero by default.
 * This value changes when {approve} or {transferFrom} are called.
function allowance(address owner, address spender) external view returns (uint256);
 * @dev Sets `amount` as the allowance of `spender' over the caller's tokens.
 * Returns a boolean value indicating whether the operation succeeded.
 * IMPORTANT: Beware that changing an allowance with this method brings the risk
 * that someone may use both the old and the new allowance by unfortunate
 * transaction ordering. One possible solution to mitigate this race
 * condition is to first reduce the spender's allowance to 0 and set the
 * desirea value afterwards:
 * https://github.com/ethereum/EIPs/issues/20#issuecomment-263524729
 * Emits an {Approval} event.
function approve(address spender, uint256 amount) external returns (bool);
```

ERC20.sol

//SlowMist// The contract does not have the Overflow and the Race Conditions issue

pragma solidity ^0.6.0;

* @dev Implementation of the {IERC20} interface.
*

- * This implementation is agnostic to the way tokens are created. This means
- * that a supply mechanism has to be added in a derived contract using {_mint}.
- * For a generic mechanism see {ERC20MinterPauser}.
- * TIP: For a detailed writeup see our guide
- $^*\ https://forum.zeppelin.solutions/t/how-to-implement-erc20-supply-mechanisms/226 [Howard National Content of the Content$

```
* to implement supply mechanisms].
 * We have followed general OpenZeppelin guidelines: functions revert instead
 * of returning `false' on failure. This behavior is nonetheless conventional
 * and does not conflict with the expectations of ERC20 applications.
 * Additionally, an {Approval} event is emitted on calls to {transferFrom}.
 * This allows applications to reconstruct the allowance for all accounts just
 * by listening to saio events. Other implementations of the EIF may not emit
 * these events, as it isn't required by the specification.
 * Finally, the non-standaro {decreaseAllowance} and {increaseAllowance}
 * functions have been added to mitigate the well-known issues around setting
 * allowances. See {IERC20-approve}.
 */
contract ERC20 is Context, IERC20 {
